REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state

Figures and letters following the station name, such as 12 SSW indicate distance in miles and direction from the post office

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin

Stations appearing in the Index, but for which data are not listed in the tables are either missing or received too late to be included in this issue

Unless otherwise indicated, dimensional units used in this bulletin are Temperature in °F, precipitation and evaporation in inches and wind movement in miles Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following table 6

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7 when published, are for the 24 hours ending at time of observation. See the Station Index for observation time

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4 30 a.m., PST, except for Weather Bureau Stations where hours of duty preclude observations at this time in which case the time is 10 30 a.m., PST. WTR EQUIV in Table 7 means the water equivalent of snow on the ground It is measured at selected stations when the depth of snow on the ground is two inches or more.

- No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5, is indicated by no entry.

+ And also on a later date or dates.

* Amounts included in following measurement, time distribution unknown.

// Gage is equipped with a windshield.

AR This entry in time of observation column in Station Index means after rain.

B Adjusted to a full month.

E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.

M One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.

R Daily precipitation values and monthly total from recording gage.

S Storage precipitation station. Precipitation measurements, made at irregular intervals will be published in the July or August or delayed data December issue of this publication

SS This entry in time of observation column in Station Index means sunset.

T Trace, an amount too small to measure.

V Includes total for previous month.

VAR This entry in time of observation column in Station Index means variable.

Subscription Price: 15 cents per copy, monthly and annual, $1 50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents Government Printing Office, Washington 25, D. C

CLIMATOLOGICAL DATA

CALIFORNIA

DECEMBER 1952
Volume LVI No. 12

See note concerning, "Hourly Precipitation Data" on page 281 of this issue.

SAN FRANCISCO: 1953

CALIFORNIA - DECEMBER 1952

E. L. Felton, Section Director - San Francisco

WEATHER SUMMARY

The average temperature for the State based on 317 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 44.5° or 1.1° below the weighted mean. The unweighted average based on the same 317 stations was 45.3° or 0.4° below the unweighted mean. The highest temperature, 90°, was recorded at Indio U.S. Date Garden in the Coachella Valley on the 14th. The lowest temperature, 20° below zero, occurred at Boca in Nevada County on the 23rd.

The average precipitation for the State based on 313 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 6.90 inches or 3.23 inches above the weighted mean. The unweighted average based on the same 313 stations was 7.43 inches, or 3.31 inches above the unweighted mean. Based on 536 stations listed in Table 3, the unweighted average precipitation was 7.95 inches or 3.83 inches above the unweighted mean. The greatest monthly total precipitation, 30.77 inches, was reported from Cazadero in Sonoma County. The greatest daily total, 10.09 inches, was recorded at Cummings in Mendocino County on the 8th. Measurable precipitation was reported from all stations in the State with El Centro in Imperial County reporting the least monthly total precipitation, 0.14 inch.

Very heavy snowfall was reported in the Sierra Nevada and northern mountain areas with 11 stations reporting a total snowfall greater than 100 inches. Snow Laboratory Central Sierra at an elevation of 6902 feet in Nevada County, reported the greatest total snowfall, 179.0 inches. Soda Springs, at an elevation of 6752 feet, near Snow Laboratory Central Sierra, reported a total snowfall of 162.7 inches. At some stations the total snowfall was the greatest for December since records began, and at others it was exceeded only one or two times. At Bowman Dam in Nevada County the 108.0 inches of snowfall was exceeded by the 137.0 inches of December 1931. At Canyon Dam the 105.5 inches of snowfall was the greatest on record for December exceeding the previous record which was recorded as 77.5 inches in December 1931. At Lake Spaulding the 115.5 inches exceeded the previous record amounts of 93.8 inches in December 1921 and 93.0 inches in December 1931. The 137.7 inch total at Mount Shasta exceeded the previous record total for December, 107.0 inches in December 1891; in December 1931 the total snowfall at Mount Shasta was recorded as 96.0 inches.

Gale to whole gale winds occurred on the 6th and 7th in the north coastal area with peak gusts reported up to about 100 miles per hour. Heavy rains resulted in closing of the Northwestern Pacific Railroad's coastal route from San Rafael to Eureka when at least 50 landslides were reported. In Coyote Valley, in the Eel River Basin, Red Cross disaster crews rescued three adults and three small children when their homes were surrounded by flood waters. Four people, two men and two small children, were killed in Branscomb in Mendocino County when, due to strong winds, a large tree was forced down on a cottage. Soils remained too wet during the month for field operations, but the abundant moisture was very favorable for pasture and range grasses.

Heavy rains during the first week in the central coastal area resulted in heavy local flood damage in Marin and San Mateo Counties when flood waters and mud entered homes and stores. The generous rains were beneficial for grasses, pastures, and ranges but interrupted pruning, planting, and harvesting activities. In Santa Cruz County heavy rains contributed to considerable erosion damage.

Rains in the upper Sacramento Valley during the first week brought some farming operations to a standstill; such as, pruning, seeding of grains, and other outside activities. Ranges, pastures, and grains already in the ground and growing benefited from the precipitation. In the northern mountain areas seve trains on the Southern Pacific's Oakland-Portland li with 1300 passengers were delayed from 13 to 31 hou due to heavy snows and strong winds. At Black Butte in the Siskiyou Mountains north of Dunsmuir, snow wa reported from four to six feet deep on the level lan and from sixteen to eighteen feet deep in drifts. Heav rains again on the 19th and 20th made most farm land inaccessible to even light farm implements, and far work for the most part remained at a standstill excep for maintenance and repair work.

Above-normal precipitation in the lower Sacrament Valley was favorable for growth of grasses, grains and other crops but delayed harvesting of some corn milo, and sugar beets. Very strong winds on the 6t and 7th with gusts to 88 miles per hour at Sacrament on the 7th resulted in some interruption of telephon and power service but only minor damage to ornamenta trees. The total precipitation at Sacramento was th greatest since 1940. In some other districts the tota precipitation for December was the greatest on record

In the lower San Joaquin Valley heavy rains durin the first week slowed cotton picking. Muddy field prevented the use of mechanical pickers in many in stances. Considerable fog during the first week con tributed to further delay in cotton picking. Cotto bales which were exposed to rains sustained some sligh damage. Field and cover crops benefited greatly fro the rains, and winter grains were reported doing satis factorily. At Fresno December was the fifth wettes on record.

Rains in the upper San Joaquin Valley benefite pastures and ranges. Generally, weather condition were favorable for all crops and harvesting activities At Bakersfield December was the wettest since 1937.

In the Santa Maria area above-normal rainfall wa detrimental to dry beans and slowed harvesting acti vities but generally favored growing crops. Wet soi conditions slowed planting operations to a large ex tent. In the Santa Barbara district rains contribute to some brown rot on lemons.

Rains during the first week in the Los Angeles area benefited grasses, grains, and cover crops, but below-normal temperatures generally slowed development o crops. Warm weather during the second week was very beneficial to development of citrus. Moderate to heavy rains during the third week resulted in moisture penetration of subsoils benefiting walnuts and other deep-rooted vegetation. Strong winds downed some trees, disrupted power and telephone service, and caused minor structural damage in some districts. Grasses, grains, and cover crops were reported growing satisfactorily. Scattered, light orchard heating was required in some colder districts on the 22nd. On the 20th a small tornado in the north end of San Fernando Valley uprooted some trees and caused other minor damage. Another partially developed tornado passed over Burbank accompanied by gusty surface winds and hailstones of from 1/2 to 3/4 inch in diameter.

Rains in the San Diego area during the first week were beneficial for celery, romaine lettuce, and lemons. Warm weather during the second decade was beneficial for a few remaining garden crops and the development of new grass in pastures and ranges.

In the Imperial Valley frosts during the first week slowed growth of lettuce and resulted in some loss to late cotton. Generally, the cool weather was beneficial for lettuce. Rains slowed lettuce cutting and hampered cotton picking. Warm weather during the second decade was favorable for development of lettuce and picking of cotton. Rains during the last week resulted in muddy fields and some inconvenience in harvesting of lettuce, carrots, and cabbage.

AVERAGES FOR THE PERIOD OCTOBER 1948 TO DATE HAVE BEEN WEIGHTED ACCORDING TO AREA AND ARE NOT COMPARABLE WITH UNWEIGHTED VALUES PUBLISHED IN THIS TABLE FOR EARLIER YEARS.

ANNOUNCING THE RESUMPTION OF PUBLICATION OF HOURLY PRECIPITATION DATA

Hourly precipitation data were published in Climatological Data through September 1951, at which time it was necessary to discontinue publication of hourly amounts, because of withdrawal of fiscal support.

Recent developments make possible the resumption of publication of these data in a new bulletin entitled "Hourly Precipitation Data". There will be one bulletin for each of the 42 climatological sections in the United States and one for Alaska. (Climatological sections correspond to States except that the six New England States comprise a single section and Maryland and Delaware comprise another.)

"Hourly Precipitation Data" will be issued monthly, with an annual summary issue. The first month to be published will be October 1951, and publications thereafter will be as rapid and as regular as funds permit. The price will be 10 cents per copy; $1.00 per year (including the annual). Checks and money orders for subscriptions should be made payable to the "Treasurer of the United States". Remittances and correspondence should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

See reference notes following Station Index.

CLIMATOLOGICAL DATA

CORRECTED DATA

JUNE 1949	Seriterre, close June 20, 1949 should have been a name change to Oroville 7 SE, instead of Oroville 7 SE being established.
SEPTEMBER 1951	Alderpoint, precipitation on 30th should be .27, monthly total .54, greatest day .27 on 30th and days with .01 or more 4.
OCTOBER 1951	Alderpoint, precipitation on 1st should be .47, monthly total 5.20 and days with .01 or more 12.
JANUARY 1952	Point Arena Light Station, add on 31st, max. temperature 55°, min. 45° and precipitation .25. Mean max. should be 52.9°, mean min. 39.3°, mean 46.1°, total degree days 578, total precipitation 8.76, greatest day 1.09 on 16th, days with .01 or more 23, .50 or more 8 and 1.00 or more 1. Susanville AP, see Delayed Data for Corrected Data, Tables 2, 3 and 5.
FEBRUARY 1952	Point Arena Light Station, see Delayed Data for Corrected Data, Tables 2, 3 and 5.
MARCH THROUGH JULY 1952	Bridgeport Dam, add 1 to min. temperature each day. Summary correction for month indicated as follows: March - Mean min. 11.1°, mean 24.8°, departure -7.4°, lowest -15°, total degree days 1175 and min. 0° or below 8. April - mean min. 27.4°, mean 41.4°, departure -0.9°, lowest 19°, total degree days, 702 and min. 32° or below, 22. May - Mean min. 34.5°, mean 52.3°, departure 3.5°, lowest 26°, total degree days 387 and min. 32° or below,11. June - Mean min. 37.3°, mean 54.6°, departure -1.1°, lowest 24°, total degree days, 304 and min 32° or below 3. July - Mean min. 46.6°, mean 64.6°, departure 1.3°, lowest 38°, and total degree days 36.
MAY 1952	El Centro, precipitation departure should be .00.
JUNE 1952	Hoegees Camp Ivy, precipitation on 25th should be .10 and monthly total .10.
JULY 1952	Lake Spaulding, delete trace on 10th, should be .00. Winters, precipitation on 10th should be .02, monthly total .02 and days with .01 or more 1.
SEPTEMBER 1952	Camptonville RS, precipitation accumulated (*) on 10th, 11th and 12th should be .04 on 10th; .07 on 11th and .22 on 12th.
NOVEMBER 1952	San Gabriel Dam FC 425 D, delete record for entire month. Westwood, precipitation on 30th should be .62, monthly total 2.71, departure -.31 and days with .01 or more 4 and .50, 3.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue

Unless otherwise indicated, dimensional units used in this bulletin are Temperature in °F, precipitation and evaporation in inches and wind movement in miles Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published are for the 24 hours ending at time of observation. See the Station Index for observation time

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4 30 a m , PST except for Weather Bureau Stations where hours of duty preclude observations at this time in which case the time is 10 30 a.m., PST. WTR EQUIV in Table 7 means the water equivalent of snow on the ground It is measured at selected stations when the depth of snow on the ground is two inches or more.

- No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5, is indicated by no entry.

+ And also on a later date or dates.

° Amounts included in following measurement, time distribution unknown.

// Gage is equipped with a windshield.

AR This entry in time of observation column in Station Index means after rain.

B Adjusted to a full month.

E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.

M One or more days of record missing; see Table 5 for detailed daily record Degree Day data, if carried for this station have been adjusted to represent the value for the full month

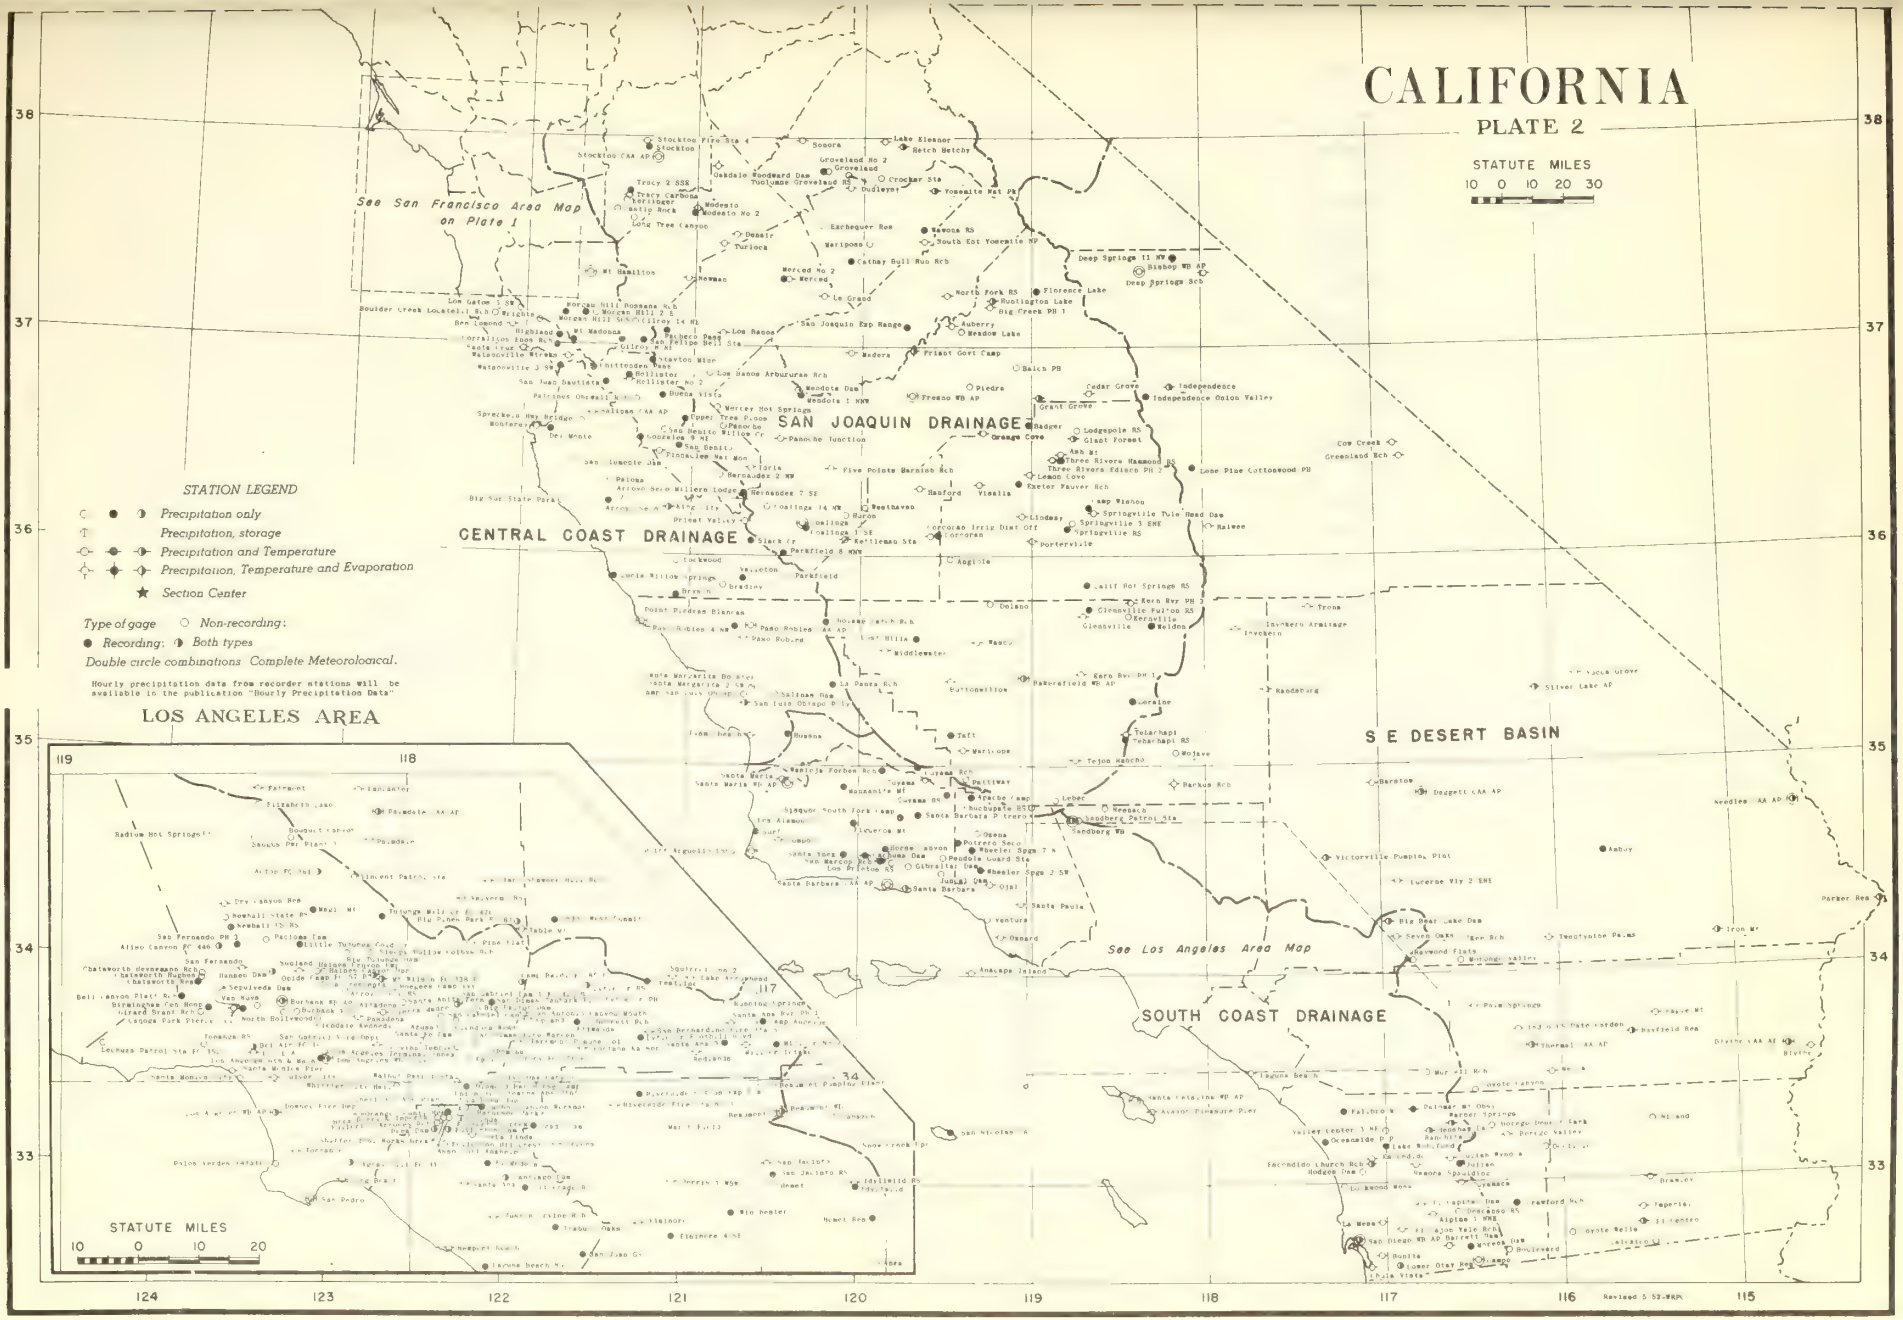
R Daily precipitation values and monthly total from recording gage.

S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December issue of this publication.

SS This entry in time of observation column in Station Index means sunset.

T Trace, an amount too small to measure.

V Includes total for previous month.



VAR This entry in time of observation column in Station Index means variable.

Subscription Price 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

CORRECTED DATA WILL BE FOUND ON PAGE 302.

ANNUAL SUMMARY 1952

Volume LVI No. 13

KANSAS CITY: 1953

CALIFORNIA - ANNUAL - 1952

E. L. Felton, Section Director, San Francisco

WEATHER SUMMARY

In 1952 heavy precipitation characterized the month of January. Heavy snowfalls in the Sierra Nevada in January contributed to depths of snow on the ground which were greater than any previously recorded at many stations in the Sierra Nevada during the months of January, February, and March. Much-below-normal temperatures in the Central Valley were notable during June. Temperatures during September and October generally averaged above normal throughout the State. Much-above-normal temperatures occurred generally during the last week of September and the first week of October.

Heavy snowfall in the Sierra Nevada in January trapped the Southern Pacific's streamliner, City of San Francisco near Donner Summit for about six days. Strong winds accompanying the heavy snowfalls resulted in considerable damage to telephone and power lines. Highways were blocked and many communities cut off from supplies and communication. Snowslides and avalanches in some localities demolished homes and other buildings killing several people. Well-below-normal temperatures in the Central Valley in June retarded the development of fruits and field crops. High relative humidities accompanying the low temperatures favored the development of mildew in orchards. The much-above-normal temperatures during the last week of September and the first week of October favored rapid maturing and ripening of crops and drying of raisins, prunes, and figs but increased irrigation water requirements. The lack of precipitation or sufficient dew restricted cotton defoliation with the use of calcium cyanimide and other chemicals requiring moisture to be effective.

SYNOPSIS BY MONTHS

Temperatures during JANUARY averaged below normal in northern portions and near normal elsewhere. Precipitation was heavy over the entire State. The unweighted average precipitation for the State for January, was equaled or exceeded only four times since 1897. The total snowfall, 245.0 inches, and maximum depth on ground, 215 inches, at Soda Springs were the greatest recorded at that station for January since records began in March 1930. Heavy rains and floods on the 12th menaced low-lying districts in the San Francisco Bay area. In Alameda County some damage occurred to the cauliflower crop when flood waters inundated hundreds of acres of farm lands. In Alviso, near San Jose in Santa Clara County, all but 25 of the population of 700 were forced to leave their homes or were evacuated as the worst flood of record resulted in waters inundating the town. On the 13th heavy snowfall in the Sierra Nevada trapped the Southern Pacific's streamliner, City of San Francisco near Donner Summit. This was the first tie-up of this railroad due to snowfall since the winter of 1889-90 when it was closed for two weeks. Heavy snowfall isolated many communities and resulted in considerable damage to the Sierra Nevada area. In Sacramento January was the wettest since 1916. At Norden in the Sierra Nevada the maximum snow depth, 218 inches, on the 17th was the greatest so early in the season since daily records began in 1898. In Bakersfield the total precipitation, 2.47 inches, was exceeded only four times in January since records began in 1889 at that station. Heavy rains in the Los Angeles area and San Diego County resulted in losses from flooding, silting, erosion, and land slides estimated at over four million dollars.

FEBRUARY temperatures averaged above normal in the central and south coastal areas and generally near normal elsewhere. Precipitation was generally light over the entire State. The snowpack in the Sierra Nevada, however, remained at record depths. The maximum depth of snow on the ground at Soda Springs, 218 inches, was greater than any depths observed in February since records began in March 1930. At Norden the maximum depth of snow on the ground was 251 inches or the greatest depth recorded so early in the season and exceeded only by a depth of 305 inches in March 1907 and March 1911 at that station. Warm weather in the central and south coastal areas contributed to rapid growth of grains and pasture grasses and increased development of fruit tree buds with trees starting to bloom in some districts. Maximum temperatures on the 5th and 6th at San Diego were the highest ever recorded on those dates at that station.

During MARCH temperatures averaged generally below normal in the central coastal area and southern portions of the State and generally much below normal in the Central Valley and northern portions of the State. Precipitation was generally heavy throughout the State except in the north coastal area and extreme northern portions. Generous snowfalls in the Sierra Nevada during March brought the snowpack to record depths. The maximum depths on the ground were greater than any previously recorded at many stations. The maximum depth on ground at Soda Springs was 268 inches. Cold, wet weather in the north coastal area was unfavorable for livestock, and many lambs died from exposure. Strong winds in the Central Valley on the 14th and 15th resulted in damages estimated at over one million dollars. In some districts entire orchards were pushed over by the strong winds. Damages were sustained by buildings, windows, power poles, automobiles, light airplanes, etc. In the Los Angeles area heavy rains and strong winds on the 14th to 16th resulted in damages estimated as follows: buildings, $20,000; automobiles, $5,000; streets, $25,000.

In APRIL near normal average temperatures occurred for the most part in the north and central coastal areas and the San Joaquin Valley. Elsewhere, temperatures averaged in the main, above normal. Precipitation was light in the north coastal and extreme northern portions, moderate in the upper Sacramento Valley, and generally heavy in other places. Much-above-normal temperatures in the upper Sacramento Valley were conducive to rapid growth of all vegetation and beneficial for most farming operations. In the lower Sacramento Valley drying, northerly winds together with much-above-normal temperatures hastened drying of soils. In some districts soils dried too quickly with crusting hindering small plants from breaking through. High temperatures contributed to rapid development of orchards and vineyards. Unusually high temperatures in the lower San Joaquin Valley early in the month were very favorable for crops and farming activities. At Fresno the maximum temperature, 92°, on the 5th was the highest temperature ever recorded so early in the season at that station. Heavy precipitation amounts during the period from the 7th to 10th interrupted farming operations and resulted in some crusting of heavy soils, necessitating replanting of some cotton in some districts. A severe hailstorm on the 9th stripped grapevines of shoots, knocked small fruit from trees, and leveled fields of alfalfa in the Caruthers-Monmouth district. Heavy rains again on the 25th resulted in some damage to second cuttings of alfalfa and made some replanting of late cotton necessary. Unusually-high temperatures in the Los Angeles area during the first week were favorable for rapid growth of all crops. The maximum temperatures at Los Angeles on the 3rd and 4th exceeded maximum temperatures on record for those dates at that station.

MAY temperatures averaged generally above normal throughout the State except for extreme southern portions and the southeastern interior where much-above-normal average temperatures obtained. Precipitation was, for the most part, light throughout the State. Below-freezing temperatures in the Napa Valley on the 5th resulted in considerable damage to grapevines and some slight damage to prunes and walnuts. Freezing temperatures in some spots in the delta region of the Sacramento Valley on the 4th damaged potatoes, asparagus, and some small tomato plants. Well-above-normal temperatures in the Central Valley during the last half of the month contributed to rapid advancement of all crops, benefited haying operations, and made considerable irrigation necessary in pastures, meadows, and truck crops. Dry, north winds together with high temperatures in the lower Sacramento Valley contributed to 'pinching' of barley heads. Strong winds in the lower San Joaquin Valley on the 15th resulted in considerable damage to crops and property. Fruit was blown from trees, and many trees were uprooted. Some cotton sustained 'sand blasting' and some shoots on grapevines were removed by the wind. Many ornamental trees were downed, branches littered streets and roads, and power lines were broken, and windows shattered. Well-above-normal temperatures in the San Diego area favored rapid ripening of Valencia oranges. Early plantings of tomatoes, cucumbers, and squash made rapid progress. In the Imperial Valley the much-above-normal temperatures benefited all crops, and by the end of the month, squash, sweet corn, and tomatoes were maturing in large quantities.

Temperatures in JUNE averaged generally much-below-normal in the Central Valley and portions of the south coastal area and, for the most part, below normal elsewhere. Precipitation was heavy in the north and central coastal areas and Sacramento Valley and light to moderate elsewhere. Cool weather in the central coastal area was unfavorable for rapid development of fruits and truck crops. Much-below-normal temperatures in the upper Sacramento Valley retarded growth of pasture grasses and the development of early peaches but reduced early irrigation water requirements. Rains benefited alfalfa and grasses but temporarily interrupted grain harvesting operations. In the lower Sacramento Valley the unusually cool weather was unfavorable for sugar beets, rice, tomatoes, truck crops, and fruits. The minimum temperature of 44° at Sacramento on the 12th was the lowest

(Continued on following page)

temperature ever recorded so late in the season and was within one degree of the lowest temperature on record for the month of June at that station. At Sacramento this was the coolest June since 1923. Cool, humid weather in the lower San Joaquin Valley contributed to considerable mildew in vineyards. Much-below-normal temperatures retarded ripening of early fruits and slowed development of early cotton and truck crops. At Fresno this was the coolest June since 1894. Much-below-normal temperatures in the upper San Joaquin Valley slowed the growth of cotton. The average temperature at Bakersfield, 71.8°, was the lowest since 1923 at that station.

In JULY above-normal to much-above-normal temperatures obtained in northern California and near-normal temperatures, for the most part, in the San Joaquin Valley and southern California. Precipitation was moderate to heavy in north portions and from light to moderate in southern portions. Much-above-normal temperatures in the upper Sacramento Valley favored ripening of peaches and rapid development of field crops. In the lower Sacramento Valley above-normal temperatures favored rice, tomatoes, and sugar beets. Fruits matured quite rapidly due to the high temperatures. High relative humidities on many days in the lower Sacramento and lower San Joaquin Valleys favored the development of mildew in orchards and vineyards; however, winds were generally light enough for dusting operations for the checking of mildew. High temperatures in the lower San Joaquin Valley hastened the development of tomatoes, bell peppers, cantaloupes, watermelons, and other crops. The minimum temperature at Fresno, 77°, on the 29th was the highest minimum ever recorded at that station on that date. Hot, humid weather in the upper San Joaquin Valley was ideal for sweet corn and cotton. An earthquake on the 21st resulted in broken irrigation pipes, caved-in water wells, damaged buildings and roads, undoing of level land surfaces, etc.

AUGUST temperatures averaged from near-normal to above-normal in northern California and from much-below-normal to much-above-normal in southern California and San Joaquin Valley. Precipitation was, for the most part, light throughout the State. Warm weather and the lack of precipitation made considerable irrigation necessary in all areas but favored fruit-picking and hay-drying activities and the development of cotton, melons, tomatoes, and other crops.

Much-above-normal temperatures obtained throughout the State in SEPTEMBER except in some north coast districts and extreme southern portions where above-normal average temperatures occurred. Light to moderate precipitation occurred in northern California and from moderate to heavy precipitation in the San Joaquin Valley and southern California. Much-above-normal temperatures favored the ripening of peaches and prunes, and the drying of fruits and hay but resulted in some sun-scalding of tomatoes. The maximum temperatures of 105° on the 19th and 102° on the 30th at Red Bluff were the highest maximum temperatures ever recorded on those dates, respectively, at that station. The maximum temperature of 100° at Sacramento on the 25th was the highest maximum ever recorded on that date at that station. Three inches of snow measured at Norden near Donner Summit was the earliest snowfall since records began in 1898. Traffic near Donner Summit was interrupted for several hours as a result of this snowstorm. Light precipitation on the 19th in the lower San Joaquin Valley resulted in considerable inconvenience to raisin drying interests. Many farmers found it necessary to rool and stack drying raisins. The minimum temperature of 44° recorded at Fresno on the 11th was the lowest temperature ever recorded so early in the season at that station. Hot weather in the Los Angeles area increased irrigation water requirements and interrupted pest-control operations. Some sun-scalding of tomatoes and damage to tender foliage was reported. The average monthly temperature, 74.3°, at Los Angeles was the second highest for September since records began at that station. The most unusual feature of the weather in the San Diego area was the long warm spell which ended on the 7th. At San Diego a period of 14 consecutive days with maximum temperatures exceeding 80° ended on the 7th. The previous record at that station for consecutive days with maximum temperatures above 80° was 11 days.

OCTOBER was characterized by much-above-normal temperatures throughout almost the entire State. The unweighted average temperature was equaled or exceeded only two times in the period since 1897. The average precipitation for the State was much-below-normal. Since 1897 only three Octobers had an average precipitation equal to or less than October 1952. Much-above-normal temperatures benefited pruning, harvesting, alfalfa drying, raisin drying, and other activities but increased irrigation water requirements in pastures and other crops. The daily maximum temperatures at Red Bluff on the 1st and 3rd exceeded any daily maximum temperatures for those dates at that station. The daily maximum temperatures on the 2nd and 5th equaled the highest maximum temperatures established for those dates with the maximum on the 5th also equaling the highest temperature on record so late in the season at Red Bluff. At Sacramento October was the driest since 1932 and the warmest since 1933. The 102° maximum temperature on the 2nd was the highest temperature ever recorded in October at Sacramento.

Temperatures in NOVEMBER averaged from near-normal to below-normal throughout the State. Precipitation was, in the main, moderate in northern California and heavy in southern California. Grains in the central coastal area were planted later than usual due to the lateness of the fall rains. Warm, dry weather in the upper Sacramento Valley during the first decade was beneficial for most fall harvesting operations, land leveling, and soil preparation activities, but the lack of early precipitation generally held up development of range grasses. Dry weather in the lower Sacramento Valley during the first 11 days was generally detrimental to foothill pastures and newly seeded grains but quite favorable for rice threshing and picking of tomatoes. The extended period of above-normal temperatures in the lower San Joaquin Valley continuing through the 13th together with the absence of precipitation was particularly beneficial to cotton, but the above-normal temperatures were generally unfavorable for coloring of Emperor grapes. Raisin harvesting was completed. The absence of killing frosts during the first decade in the Los Angeles area permitted continued harvesting of late tomatoes. Moderate to heavy rains on the 14th and 15th soaked soils and benefited vegetation, particularly grains and grasses. All irrigation operations were suspended. Some local flooding and erosion damage was caused by heavy showers. Some unthreshed lima beans were damaged to some extent by the rains. Warm weather during the first week in the Imperial Valley was unfavorable for lettuce with some bolting of lettuce reported. High temperatures and light winds, however, were ideal for cotton harvesting and the development of new alfalfa. Cool weather during the latter portion of the month favored lettuce and carrots in the Imperial Valley but contributed to lowering the quality of tomatoes in the San Diego area.

Temperatures in DECEMBER averaged near-normal in northern portions and, for the most part, above-normal elsewhere. Precipitation was heavy in northern California and moderate in the southern one-third of the State. Heavy rains in the central coastal area benefited grasses, pastures, and ranges but interrupted pruning, planting, and harvesting activities. At Sacramento December was the wettest since 1940. At Fresno December was the fifth wettest on record. Cotton picking in the San Joaquin Valley was slowed as a result of the heavy rains. On the 20th a small tornado was reported over the north end of San Fernando Valley, uprooting trees and causing other minor damage. Another partially developed tornado passed over the Burbank area accompanied by gusty surface winds and hailstones of from one-half to three-fourths inch in diameter. Warm weather and moderate rains in south coastal area were very beneficial for grains, fruits, grasses, and other crops.

REFERENCE NOTES

Unless otherwise indicated, dimensional units used in this bulletin are Temperature in °F, precipitation and evaporation in inches, and wind movement in miles. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 4.

The four digit identification numbers in the Index are assigned on a state basis. There will be no duplication of numbers within a state.

Data for recorder stations, denoted by "C", are processed for special purposes and published later in Hourly Precipitation Data.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Delayed data and corrections will be carried in the June and December issues of Climatological Data.

No record.

\+ Also later date (dates) or months.

* Amount included in following measurement

// Gage is equipped with a windshield.

B Adjusted to full month

E Amount is wholly or partially estimated

M Less than a complete month of record available. If average value is entered, less than 10 days of record are missing. See monthly Climatological Data for detailed daily record.

R Data from recording gage

T Trace, an amount too small to measure.

V Includes total for previous months. V in annual column means total is for a two-year period.

S Storage precipitation station Data will be published in the July or August or delayed data December issue of Climatological Data.

Subscription Price 15 cents per copy, monthly and annual, $1.50 per year (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to Superintendent of Documents, Government Printing Office, Washington 25, D. C.

CALIFORNIA

JANUARY 1953
Volume LVII No. 1

SAN FRANCISCO: 1953

E. L. Felton, Section Director - San Francisco

WEATHER SUMMARY

January 1953 was the warmest on record. All stations reported average temperatures well above normal with stations in the Sierra Nevada and other interior areas reporting the greatest anomalies. In northern portions of the State and the Sierra Nevada much-above-normal average temperatures obtained largely as a result of average daily minimum temperatures being greater than any previous average daily minimums at many stations. Average daily maximum temperatures were also very high but generally exceeded in January 1948. In southern portions of the State both average daily maximum temperatures and average daily minimum temperatures were greater than any previously recorded at many stations. The average temperature for the State based on 317 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 49.0° or 5.2° above the weighted mean. The unweighted average based on the same 317 stations was 49.6° or 5.3° above the unweighted mean. The unweighted average, 49.6°, exceeded the unweighted average of all Januarys since 1897, when such statistics were first computed, with the previous record average being 48.5° for January 1920. The highest temperature, 92°, was reported on the 11th at El Cajon Yale Ranch in San Diego County. The lowest temperature, 7° below zero, was recorded on the 27th at Soda Springs in Nevada County at an elevation of 6752 feet above mean sea level.

The average precipitation for the State based on 321 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 4.45 inches or 0.47 inch above the weighted mean. The unweighted average based on the same 321 stations was 4.66 inches or 0.26 inch above the unweighted mean. Based on 545 stations listed in Table 3 the unweighted average was 4.91 inches or 0.51 inch above the unweighted mean. In northern California precipitation ranged from above normal to much above normal with greatest departures in the north coastal area. The greatest monthly total precipitation, 36.63 inches, was reported from Gasquet Ranger Station in Del Norte County. In the southeastern interior thirteen stations reported a total of zero precipitation, and nine reported only a trace. The greatest daily precipitation amount, 9.82 inches, was recorded at Klamath on the 17th.

Precipitation was well above normal in northern California but, due to the much-above-normal temperatures, a large portion fell as rain to high elevations and resulted in above-normal to much-above-normal runoff rather than the usual increase in snowpack storage. Snow surveys made by the State of California indicated a snowpack in the Sierra Nevada considerably less than a year ago but with a generally greater than normal water content. Snowfall was below normal with only four stations reporting a monthly total of more than 50 inches: Snow Laboratory Central Sierra, 72.4 inches; Soda Springs, 68.0 inches; Twin Lakes, 66.5 inches; and Blue Canyon WB Airport, 57.6 inches.

Much-above-normal temperatures in the north coastal area during the second week were followed by heavy rains during the third week. Torrential rains from the 16th to the 18th resulted in flooding on practically every river and stream in the northwestern portion of the State. On the Klamath River near the city of Klamath the preliminary provisional discharge on the 18th was reported as 280,000 cfs compared to the previous peak flow of 197,000 cfs on February 2, 1952. Flooding also occurred on the Smith River but with stages reported lower than in October 1952. A large percentage of the population in the vicinity of the mouths of Redwood Creek and the Klamath River moved out as the floods threatened. Press reports stated that Klamath Glen, about ten miles up the Klamath River, was practically wiped out when homes in the summer colony were washed down the river. Highway 101, from Eureka to the Oregon border, was closed by high water and earth slides. Telephone and power lines were broken as a result of earth slides and falling trees. Considerable quantities of logs and lumber were carried away by the flood waters, and many farm animals were reported drowned. Many individuals and families were isolated by the floods and slides. At Scotia Bluff a large earth slide caused a Northwestern Pacific Railroad locomotive to plunge into the Eel River carrying three crewmen to their death. Flood damages were estimated in the millions of dollars with the bulk of the losses reported to roads, culverts, and small bridges. A special report from the Red Cross indicated that in northern California the floods resulted in eight deaths, 30 injuries, 30 homes destroyed, 50 homes damaged to a major extent, 131 homes damaged to a minor extent, five other buildings destroyed, five other buildings damaged to a major extent, and 75 other buildings damaged to a minor extent. Of the deaths seven occurred in Humboldt County and one in Del Norte County. Of the homes destroyed 15 were in Del Norte County, and 15 were in Humboldt County. A Table of Comparative Precipitation Data referring to the heavy rainfall in the north coastal area for the period January 16-19, 1953 will be found on page 12.

Warm, wet weather in the central coastal area resulte in rapid growth of grasses, truck crops, and field crops Pruning, spraying, cultivation, and other field activitie were delayed due to wet soil conditions. In Santa Cru County heavy rains interrupted or stopped all field wo and started some earth slides; soils in hill districts we reported about saturated, with many springs running gene ously. Above-normal temperatures contributed to bringi on early blossoming and early fruiting of some early berri and blossoming of some fruit trees in the Santa Clara Va ley. In Sonoma County buds were starting to swell on pru trees, particularly the Imperial variety, by the end of t month.

Wet, damp conditions in the upper Sacramento Valley du ing the first three weeks kept farm activities nearly to standstill. Some pruning and other orchard work continue as weather permitted. Much-above-normal temperatures du ing the second week with generally above-normal temper tures otherwise were favorable for development of ran grasses and grains but were unfavorable for fruit and nu trees which require a dormant season. At Red Bluff th was the first January since 1885 in which no freezing te peratures were observed.

Rains in the lower Sacramento Valley during the firs three weeks interrupted pruning and spraying operations a other farm work. Water which accumulated in low spots o grain fields in some districts resulted in some yellowi of grains. Much-above-normal temperatures contributed t rapid development of almond buds. At Sacramento the aver age daily maximum temperature was the greatest since 194 the average daily minimum temperature, the greatest sinc 1909, but the average daily temperature was the highest o record. The minimum temperature of 58° on the 9th was th highest minimum temperature ever recorded at Sacramento i January, exceeding by 2° the previous high January minimum Daily maximum temperatures on the 8th and 9th exceeded th previous record maximums for those dates at Sacramento.

Rainfall and much-above-normal temperatures in the lowe San Joaquin Valley during the first two weeks were ver beneficial for range grasses, cover crops,and winter grains Rains were somewhat unfavorable for harvesting cotton an other crops, with the quality of cotton standing in field slightly lowered as a result of discoloration. Much-above normal temperatures during the last two weeks were favor able for winter grains and alfalfa which were up to goo stands and growing satisfactorily. Cover crops and grasse on pastures and ranges were growing rapidly. At Fresn this was the second warmest January on record. The maximu temperature at Fresno on the 9th, 70°, was the highest max imum ever recorded on that date at that station. A mini mum temperature lower than 32° was observed on only one da at Fresno. On the average, six days with subfreezing tem peratures occur in January.

Weather in the upper San Joaquin Valley was, for th most part, favorable for crops and harvesting operation except for rains which slowed cotton harvesting and potat planting during the first half of the month. Temperature during the second week were much-above-normal.

In the Santa Maria area rains during the first half o the month benefited grasses but interrupted planting oper ations and slowed harvesting activities. Much-above-norma temperatures were very favorable for growth of grains, truc crops, and grasses on pastures and ranges. At Santa Mari the average temperature was 3° above the previous high av erage temperature established in 1948. The average dail minimum temperature was the highest of the 11 years o record. Also this was the first January in 11 years a Santa Maria in which the minimum temperature did not dro to 32° or lower.

Much-above-normal temperatures in the Los Angeles are resulted in rapid growth of grasses, grains, and cove crops. Deciduous fruit buds developed early with some blos soming of ornamentals in the metropolitan area. Sauce peaches came into full bloom in most districts. At Lo Angeles this was the third warmest January of record.

Abundant soil moisture together with above-normal tem peratures and considerable sunshine in the San Diego are provided excellent growing conditions for all crops. A San Diego this was the warmest January on record with th maximum temperature of 88° on the 10th being the highes ever recorded in January at that station. Maximum tempera tures on the 10th, 23rd, 29th, 30th, and 31st exceeded pre vious high temperatures for those dates.

In the Imperial Valley weather was favorable for citru and growth of all crops.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 1 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index but for which data are not listed in the tables are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperature in F, precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following table h.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 a.m., PST, except for Weather Bureau stations where hours of duty preclude observations at this time in which case the time is 10:30 a.m., PST. WTR EQUIV in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more.

- No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5, is indicated by no entry.

+ And also on a later date or dates.

* Amounts included in following measurement, time distribution unknown.

// Gage is equipped with a windshield.

AR This entry in time of observation column in Station Index means after rain.

B Adjusted to a full month.

E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.

M One or more days of record missing, see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.

R Daily precipitation values and monthly total from recording gage.

S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December issue of this publication.

SS This entry in time of observation column in Station Index means sunset.

T Trace, an amount too small to measure.

V Includes total for previous month.

VAR This entry in time of observation column in Station Index means variable.

Subscription Price: 15 cents per copy, monthly and annual, $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

CALIFORNIA

FEBRUARY 1953
Volume LVII No. 2

SAN FRANCISCO: 1953

CALIFORNIA - FEBRUARY 1953

E. L. Felton, Section Director - San Francisco

WEATHER SUMMARY

The average temperature for the State based on 319 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 48.0° or 0.9° above the weighted mean. The unweighted average based on the same 319 stations was 48.4° or 1.2° above the unweighted mean. The highest temperature, 95°, was recorded at Indio U.S. Date Garden on the 8th. The lowest temperature, 0°, occurred at Twin Lakes at an elevation of 7920 feet in Alpine County on the 18th.

February 1953 was the second driest based on the period of record beginning with 1897. The average precipitation for the State based on 321 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 0.51 inch or 3.51 inches below the weighted mean. The unweighted average based on the same 321 stations was 0.50 inch or 4.04 inches below the unweighted mean. Based on 551 stations listed in Table 3 the unweighted average precipitation was 0.49 inch or 4.05 inches below the unweighted mean. The greatest monthly total precipitation, 10.21 inches, occurred at Gasquet Ranger Station, Del Norte County, in the extreme northwest portion of the State. The greatest daily total precipitation, 3.79 inches, occurred on the 5th at Klamath in Del Norte County. Of 113 stations, mostly in the central coastal and other central portions of the State, 80 stations reported a total of zero precipitation, and 34 stations only a trace.

The driest February of the period of record beginning 1897 occurred in 1899, when the unweighted average precipitation for the State was reported as 0.45 inch. In only three previous years the unweighted average precipitation for the State was reported as less than one inch for the month of February: 1900,0.94 inch; 1912, 0.75 inch; and 1933, 0.83 inch. Records indicate that prior to 1897, February precipitation was very light in 1896, 1886, 1885, and 1875; however, average precipitation values for the State for these years are not available. In February 1953 precipitation in the extreme north coastal area averaged from 50 to 75 per cent of normal, in extreme northeastern interior portions from near normal to slightly above normal, and in San Diego County and scattered districts in the Los Angeles area generally from 20 to 35 per cent of normal. Elsewhere, precipitation was, in the main, less than five per cent of normal. In large portions of central California no measurable precipitation was reported. As the month ended in central California many stations recorded a period of 38 days without measurable precipitation. In Ventura County some stations recorded a period of 45 rainless days as the month ended. In Imperial, Riverside, San Bernardino, and Inyo Counties some stations recorded up to 70 days without measurable precipitation at the close of the month. The following stations recorded no measurable precipitation in February 1953 but also recorded no measurable precipitation in some previous February of record: Antioch 1 E, 1886; Calexico, 1951 and previous years; Coalinga, 1912; Colusa High School, 1875; Greenland Ranch, 1950 and previous years; Hawee, 1933; King City, 1896, 1910, 1912; Lemon Cove, 1912; Los Alamos, 1912; Napa State Hospital, 1886, 1899; Newman, 1896, 1899; Oakdale Woodward Dam, 1896, 1912; Ojai, 1910, 1912, 1933; Oxnard, 1933; Paso Robles, 1912; San Luis Obispo, 1885, 1896; Santa Monica, 1888, 1896, 1900; Santa Paula, 1894; Trona, 1951 and previous years. To emphasize further the intensity and wide-spread character of the drought of February 1953 a comparative precipitation table for all Februarys of record will be found on Page 37 of this bulletin.

As a result of the light precipitation and moderate temperature, snowfall was generally very light except in scattered mountain districts in southern California. Two stations both in southern California reported a total of 20.0 inches or more; Raywood Flats at an elevation of 7200 feet in San Bernardino County, 21.5 inches; Big Pines Park FC 83 at an elevation of 6860 feet in Los Angeles County, 20.0 inches. Ten stations, mostly in southern California, reported a total snowfall of 10.0 inches or more but less than 20.0 inches. At Soda Springs the 6.0 inches of snowfall for February 1953 was the least snowfall at that station for February since records began in March 1930. The previous record low February snowfall at Soda Springs was 16.0 inches in 1947. Huntington Lake and Giant Forest with total snowfalls of 2.0 inches and 5.0 inches respectively, reported the least snowfalls for February based on the period 1921 to date for these stations. See Table of Comparative Snowfalls and Greatest Depth on Ground for February, Page 45, Climatological Data, California Volume 56, No. 2, February 1952. The snow in southern California occurred with the only precipitation of the month on the 23rd and 24th.

Soils in the north coastal area remained, for the most part, too wet for farming operations. Lambing continued under favorable weather conditions, and vegetable gardens were reported in good shape.

The lack of precipitation in the central coastal area during the first half of the month permitted considerable progress in planting of crops, pruning and spraying of fruit trees, etc. Above-normal temperatures favored rapid growth of truck crops and development of fruit trees. In Santa Clara County almond trees were in bloom and peach and apricot blossoms colored earlier than usual. The continued lack of precipitation during the last half of the month resulted in starting of irrigation in row crops in Monterey County and some other districts. Strong winds on the 23rd were generally unfavorable for agriculture and other interests. Many limbs on shade and fruit trees were broken, and some trees were uprooted. Roofs were damaged, fences downed, and power lines broken in scattered districts. Generally the strong winds contributed to further drying of the soils and aggravated the dry conditions which resulted from the very subnormal precipitation for this time of year. Fortunately soils in orchards were very dry at the time of the strong wind or many trees would have been uprooted. In Santa Clara, Santa Cruz, and Monterey Counties the strong winds and lack of rainfall were particularly detrimental to pastures and grains. Blowing dust and sand in Santa Cruz County damaged some lettuce plantings. At San Francisco February 1953 was the driest February since 1864 when no rain occurred during the entire month. It was also the second driest February since records began in October 1849 at that station.

Warm, dry weather in the upper Sacramento Valley during the first half of the month following the previous wet spell was very favorable for growth of grains and grasses but unfavorable for fruit and nut trees which had not experienced a good dormant season. Buds on some types of trees were beginning to swell due to the warm weather. Seeding of grains and plowing operations were carried out on a large scale. During the month the lack of adequate precipitation together with dry, northerly winds had a very desiccating effect upon grains and range grasses, and pasture crops were slowed somewhat due to the lack of rainfall. Almonds and apricots blossomed early as a result of the above-normal temperatures. At Red Bluff February was the driest since 1899. At Mount Shasta February was the driest since 189[illegible] when only 0.21 inch of precipitation was recorded. The maximum temperature of 71° on the 27th at Mount Shasta was the highest maximum temperature recorded at that station since 1917.

In the lower Sacramento Valley much-above-normal temperatures together with the lack of persistent fogs during the first week contributed to the rapid drying of grain fields which were too wet. Above-normal temperatures resulted in early development of fruit buds with some early almonds in bloom and leafing by the middle of the month. Most apricot orchards were in full bloom by mid-month, the earliest blossoming date for apricots since February 1941. Drying northerly winds during the month had a very desiccating effect upon grains, alfalfa, pasture and range lands. Irrigation became necessary in alfalfa, and grains manifested a great need for moisture in many places. At Sacramento February was the driest since 1913. The 0.03 inch of precipitation at that station from January 21st through February 27th resulted in one of the longest mid-winter drought of record, the longest since January-February 1917.

Warm weather and considerable sunshine during the first week in the lower San Joaquin Valley permitted the harvesting of the last remnants of the cotton crop. Cover crops, grains, and grasses made rapid growth as a result of the warm weather. Above-normal temperatures contributed to early blossoming of some fruit trees and other trees. Desiccating winds on the 8th together with the lack of rainfall resulted in crusting of soils in some districts. Below freezing temperatures during the latter half of the month resulted in some damage to crops. Temperatures as low as 22° were reported in the Fresno district. Strong winds caused considerable inconvenience to farmers in the Stockton district. Many acres of sugar beets, onions, and spinach were replanted as a result of wind damage. By the end of the month pastures were reported in great need of more precipitation, and irrigation was beginning in some districts. At Fresno February was the driest since 1912.

In the upper San Joaquin Valley weather conditions during the first half of the month were generally favorable

WEATHER SUMMARY (Continued)

for the planting of potatoes and development of buds on prunes and apricots. The lack of precipitation, however, was unfavorable for unirrigated grains and ranges which were in need of more moisture. Below-freezing temperatures on the 19th, 20th, and 21st resulted in freezing of practically all potato plants which had emerged above the ground resulting in a general set-back in the development of the potato crop. Cold weather during the latter portion of the month generally retarded opening of blossoms on fruit trees; however, peaches and prunes were reported in full bloom in some districts.

Weather in the Santa Maria area during the first week was ideal for the growth of all crops, and planting operations proceeded at top speed. Strong winds together with the absence of precipitation during the second and third weeks contributed to some 'tipburn' on grasses. By the third week grain crops in open, flat lands had deteriorated beyond the stage where precipitation would have been helpful. Frosts during the last decade resulted in considerable damage to artichokes and some damage to alfalfa in low spots. In the San Luis Obispo district about half of the almond crop was reported damaged by frost.

Well-above-normal temperatures in the Los Angeles area during the first week resulted in rapid development of all crops and early blooming of deciduous trees. Grains on some light soils were in need of more rain, and some orchards on sandy soils were under irrigation. Generally topsoils dried rapidly but subsoils still had adequate moisture. Above-normal temperatures, winds, and lower relative humidities during the second week contributed to rapid drying of topsoils with some grains showing effects from the lack of adequate moisture. Early deciduous fruits blossomed in some districts and new growth on citrus was reported several weeks earlier than usual. Frosts during the third decade resulted in an estimated damage of from 10 to 15 per cent in unheated citrus districts. New citrus growth and blossoms were damaged. Considerable damage was also sustained by deciduous fruit buds and blossoms in the Beaumont district. Precipitation on the 23rd, although light, in most districts, revived grasses and benefited grains and other crops temporarily.

Much-above-normal temperatures in the San Diego area during the first week resulted in unusually rapid growth of crops. Oats and barley were reported in very good condition but required irrigation in several districts. Weather conditions were ideal for soil preparation and planting activities and capping of plants. Cold weather in the San Diego area during the last decade resulted in some damage to tender garden vegetables and some fruit which had set earlier. The lack of sufficient precipitation together with dry, northeasterly winds during the first 22 days made considerable irrigation necessary. Rains on the 23rd revived pasture grasses and grains to some extent but were generally of ephemeral benefit.

In the Imperial Valley cantaloupes made very rapid growth as a result of the warm weather. During the last week some alfalfa was damaged by blowing sand cutting plants.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are Temperature in °F, precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 a.m., PST, except for Weather Bureau Stations where hours of duty preclude observations at this time in which case the time is 10:30 a.m., PST. WTR EQUIV in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more.

-	No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5, is indicated by no entry.
+	And also on a later date or dates.
*	Amounts included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
AR	This entry in time of observation column in Station Index means after rain.
B	Adjusted to a full month.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Daily precipitation values and monthly total from recording gage.
S	Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December issue of this publication.
SS	This entry in time of observation column in Station Index means sunset.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
VAR	This entry in time of observation column in Station Index means variable.

Subscription Price 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

CALIFORNIA

MARCH 1953
Volume LVII No. 3

SAN FRANCISCO: 1953

CALIFORNIA - MARCH 1953

E. L. Felton, Section Director - San Francisco

WEATHER SUMMARY

The average temperature for the State based on 316 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 50.8° or 0.6° below the weighted mean. The unweighted average temperature based on the same 316 stations was 50.4° or 0.6° below the unweighted mean. The highest temperature, 97°, was reported at Blythe in Riverside County on the 27th. The lowest temperature, 9° below zero, was recorded at Soda Springs in Nevada County on the 14th.

The average precipitation for the State based on 317 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 2.32 inches or 1.01 inches below the weighted mean. The unweighted average based on the same 317 stations was 2.48 inches or 1.27 inches below the unweighted mean. Based on 540 stations listed in Table 3 the unweighted average precipitation was 2.62 inches or 1.13 inches below the unweighted mean. The greatest monthly precipitation, 13.10 inches, was reported from Gasquet Ranger Station in Del Norte County. The greatest daily total precipitation, 5.15 inches, occurred at Ben Lomond in Santa Cruz County on the 19th. Four stations in the southeastern interior reported no precipitation, and five stations reported only a trace.

The greatest monthly total snowfall, 96.8 inches, occurred at Snow Laboratory Central Sierra. Six other stations reported a total snowfall of 60 inches or more: Blue Canyon WB AP, 80.6 inches; Bowman Dam, 72.0 inches; Lake Spaulding, 69.0 inches; Soda Springs, 76.0 inches; Twin Lakes, 71.0 inches; Cisco Ranger Station, 76.8 inches. At Soda Springs the total snowfall of 76.0 inches was exceeded eight times for the month of March for the period of record beginning with March 1931. The greatest depth of snow on ground, 103 inches, was exceeded 13 times for March for the same period. For further information on comparative snowfall refer to Table of Comparative Snowfalls and Greatest Depth on Ground for March in March 1952, Climatological Data, California, Page 69.

Rains in the north coastal area during the month were very beneficial for range grasses and other crops. Soils during the second decade were generally too wet for farm work; however, by the end of the month they were almost dry enough for plowing operations.

The lack of adequate rainfall in the central coastal area during the first decade was very unfavorable for grasses, field crops, and truck crops. Frost on the 1st, 2nd, and 3rd resulted in considerable damage to prunes, pears, peaches, apricots, almonds, artichokes, and some other crops. In the coastal area of San Mateo County from Pescadero to Half Moon Bay frost damage on the 2nd and 3rd occurred in young artichoke buds which were nipped or killed in many places. Precipitation during the second decade was very beneficial for pasture and ranges grasses.

The continued lack of adequate precipitation together with dry, northerly winds in the upper Sacramento Valley had a very desiccating effect upon grains and range grasses. Below-freezing temperatures during the second decade contributed to some damage to almonds, peaches, and prunes in unheated orchards. At Red Bluff the total precipitation for the two-month period February and March, 0.81 inches, equaled the least amount for that two-month period established in 1923. The fastest mile of wind on the 19th at Red Bluff was recorded as 63 miles per hou from the southeast, which exceeds the previous fast est mile at that station, 60 miles per hour from th southeast, in December 1952. The 60 mile-per-hou record was based on 30 years of record.

Rains in the lower Sacramento Valley during th second and third weeks were beneficial to all agri cultural interests, particularly grain and livestoc farmers in districts where irrigation was not pos sible.

Below-freezing temperatures in the lower San Joa quin Valley on the 1st, 2nd, and 3rd resulted i considerable orchard heating in almonds, prunes, an some other crops. The minimum temperature of 26 at Fresno on the 2nd was the lowest temperature eve recorded at that station for the month of March. O the 2nd below-freezing temperatures in the Fresn area resulted in considerable damage in fig districts As much as 100 percent of the terminal buds wer killed in some places. Districts north and west o Clovis sustained greatest damage with 60 to 100 per cent of the terminal buds killed. At Fig Garden 2 to 30 percent were killed. Around Herndon only 5 to 10 percent of the buds were damaged. The injur was confined to the Adriatic variety and Capri figs Light rains during the month were of only ephemera benefit to crops. The lack of adequate precipita tion contributed to an increase in the serious drough conditions. Some preplanting irrigation was carrie out for cotton. Generally, irrigated grains were reported in satisfactory condition,but unirrigate grains were reported, for the most part, worthless except for sheep pasture.

Above-normal temperatures in the upper San Joaqui Valley from the 5th to the 9th were favorable fo reviving frost-bitten potatoes. Warmer weather als favored blossoming of fruit trees and the developmen of asparagus and lettuce. Scattered showers on th 1st were of little value in reviving dry grass land and unirrigated wheat. Generally, weather condition were favorable for crops except for the lack of ade quate precipitation which resulted in increased ir rigation as well as poor conditions of ranges an dry-farmed grains.

Precipitation in the Santa Maria area on the 1s had little effect in alleviating the drought as pas tures and ranges continued in an extremely dry con dition. A light amount of hail which also occurre on the 1st contributed to some slight damage to ma ture lettuce and some newly-thinned young lettuce. The total precipitation for the two-month period o February and March, 0.91 inch, was the least tota for that two-month period since 1900. The previous least February-March total since 1900 was 1.24 inches in 1923 and 1933.

Light rains in the Los Angeles area on the 19t and 20th were of some benefit to shallow-rooted crops but insufficient to penetrate into subsoils. Grains and grasses were revived to some extent, but grasses were generally maturing. Irrigation in orchards continued on near summertime schedules. Warm weathe from the 22nd to the 24th accelerated growth of veg etation and favored germination of seeds.

In the San Diego area some hail on the 1st resulted in some pitting of lemons. Light showers during the month were beneficial for all vegetation; however, more moisture was needed.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperature in °F, precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4 30 a.m., PST, except for Weather Bureau Stations where hours of duty preclude observations at this time in which case the time is 10 30 a.m., PST. WTR EQUIV in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more.

-	No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5, is indicated by no entry.
+	And also on a later date or dates.
*	Amounts included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
AR	This entry in time of observation column in Station Index means after rain.
B	Adjusted to a full month.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Daily precipitation values and monthly total from recording gage.
S	Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December issue of this publication.
SS	This entry in time of observation column in Station Index means sunset.
T	Trace, an amount too small to measure.
W	Includes total for previous month.
VAR	This entry in time of observation column in Station Index means variable.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

SAN FRANCISCO: 1953

CALIFORNIA - APRIL 1953

E. L. Felton, Section Director - San Francisco

WEATHER SUMMARY

The average temperature for the State based on 317 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 55.3° or 1.7° below the weighted mean. The unweighted average temperature based on the same 317 stations was 54.1° or 1.8° below the unweighted mean. The highest temperature, 105°, was recorded at Greenland Ranch on the 23rd and Cow Creek on the 23rd and 24th. The lowest temperature, 7° below zero, was recorded at Soda Springs in Nevada County on the 12th.

The average precipitation for the State based on 318 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 2.22 inches or 0.52 inch above the weighted mean. The unweighted average based on the same 318 stations was 2.44 inches or 0.56 inch above the unweighted mean. Based on 546 stations listed in Table 3, the unweighted average precipitation was 2.50 inches or 0.62 inch above the unweighted mean. The greatest monthly precipitation, 10.34 inches, was reported from Blue Canyon WB AP in Placer County. Bullards Bar Power House in Yuba County reported the greatest daily total precipitation, 5.60 inches, on the 27th. Eight stations in the southeastern interior reported only a trace of precipitation, and another eight stations reported no precipitation.

Snowfall for April was well above normal at many stations in the Sierra Nevada with six stations reporting a total of more than 40 inches: Snow Laboratory Central Sierra, 68.3 inches; Soda Springs, 60.0 inches; Twin Lakes, 59.0 inches; Cisco Ranger Station, 52.6 inches; Blue Canyon WB AP, 48.2 inches; Lake Spaulding, 45.5 inches. At Lake Spaulding the total snowfall for April, 45.5 inches, was 28.5 inches above the long-period mean and exceeded only by the 81.8 inches which occurred in April 1948. At Soda Springs the total snowfall was 29.0 inches above the long-period mean.

Soils in the north coastal area dried sufficiently during the first week to permit plowing operations, and considerable ground was prepared for potatoes and other root crops. Rains during the second week slowed plowing operations which had become quite general. Rains during the latter half of the month were very beneficial for pastures and ranges.

Heavy frosts in the central coastal area during the second week resulted in considerable damage to fruits and nuts. In Mendocino County frosts on the 8th hit some walnuts that were out early and contributed to some damage to pears and prunes. Most grapes had not advanced enough to sustain frost damage. In Lake County heavy frosts on the 8th and 9th caused considerable damage to prune and pear crops. On the morning of the 7th severe frost damage was reported in Somoma County with the prune crop most severely affected; losses were reported up to 75 percent for the county. Grapes, pears, walnuts, and some apples were also damaged. Also early planted vegetables sustained some losses. In Napa County the major freeze which invaded the Napa Valley on the 7th and continued through the 8th resulted in preliminary estimates of damages of 75 percent to the prune crop and something less than 50 percent to the grape crop. Nut crops and other fruits were also hit with a total loss of walnuts in many sections. Temperatures on the morning of the 7th from Napa to Saint Helena were generally from 26° to 28° with cold spots reporting temperatures as low as 25°. From Saint Helena to Calistoga temperatures were generally higher due to wet soils and light winds most of the night. Duration of temperatures below 30° in the Napa Valley and Rutherford sections equaled or exceeded four hours. On the morning of the 8th temperatures at Napa and Calistoga were 29° or higher due to a cloud cover which moved in after 2:00 a.m. In the Oakville and Rutherford sections clouds did not arrive until about 5:00 a.m., and orchards were heated for about three hours. At Gordon Valley on the same morning, orchard heating was necessary for apricots from 1:00 a.m. to 6:00 a.m. This was the first major freeze in the Napa Valley since 1936 with only a few nights of orchard heating in most years since that time. Temperatures during this freeze were from one degree to two degrees higher than March 25, 1936, but since fruits were generally advanced about two weeks compared to a normal season, they were in the most vulnerable state. In Santa Clara County considerable frost damage was reported to apricots, prunes, and some other crops. In San Benito County severe frost damage occurred in spots, to apricots, prunes, and walnuts. Showers on the 10th were of some benefit to some crops but unfavorable for pears and apples as the moisture favors development of scab and blight. Frost in the southern portion of Santa Cruz County contributed to some damage to apricots, prunes, and truck crops. During the last week rains benefited some pastures and some late grains but were detrimental to strawberries which sustained some damage from mold and rot. Some damage was also sustained by hay crops. At San Francisco, April was comparatively cool and dry except for the last five days when heavy rains occurred. The greatest 24-hour precipitation for April 1953, 2.36 inches, which occurred on the 26th-27th at San Francisco was the greatest 24-hour precipitation for April at that station since 1896.

Warm weather in the upper Sacramento Valley during the first week was beneficial for most fruit crops, irrigated pastures, and some other crops; however, the lack of precipitation was unfavorable for range grasses and grains. Much-below-normal temperatures from the 7th to 10th, inclusive, were unfavorable for the growth of crops. Light precipitation during this period was generally beneficial for range grasses and other crops. Much-above-normal temperatures on the 21st and 22nd contributed to rapid drying of soils and necessitated considerable irrigation in irrigated pastures and other crops. Generally, the warm weather favored the development of most crops. During the last five days heavy rains occurred accompanied by severe thunderstorms on the 27th, 29th, and 30th. Grasses and grains received the greatest benefits from the precipitation. A few sheep which had just been sheared were reported killed by exposure to cold, driving rains during the severe thunderstorms. Unseasonably warm weather in the Mount Shasta district from the 18th to the 25th, inclusive, brought most fruit trees in that locality into bloom, while a killing frost on the 30th resulted in heavy losses to local fruit crops at Mount Shasta and also in the vicinity of McCloud, about nine miles to the east, where a low temperature of 21° was reported.

Below-normal temperatures in the lower Sacramento Valley during the second week were unfavorable for the development of crops. The lack of adequate precipitation during the first 25 days slowed growth of unirrigated vegetation with grain crops affected to the greatest extent. Heavy rains during the last five days accompanied by thunderstorms on the 27th, 29th, and 30th resulted in considerable damage to crops. A substantial portion of the first cutting of alfalfa sustained some rain damage. About one-third of the first crop of strawberries was severely damaged as a result of mold and rot. Also some dirt and mud was spattered on strawberries by the rains. In Solano County a large portion of the early cherry crop cracked as a result of the early rains. In the Kelsey-Garden Valley district in El Dorado County a hailstorm on the 29th resulted in virtually a total loss of the cherry crop, light losses in apples, and losses of from 50 percent to 100 percent in pears. Damages varied with orchard and location, and only six orchards were affected to any extent. In the Auburn, Bowman, Newcastle, Ophir, and Mount Vernon districts of Placer County, hail on the 29th marked pears, plums, cherries, and peaches, requiring farmers to thin fruit again. Damages were heavy over five square miles and light over an additional five square miles with losses estimated at $750,000. The maximum temperature of 84° on the 4th at Sacramento was the highest temperature ever recorded at that station for that date. Also, the minimum temperature of 34° on the 8th was the lowest temperature ever recorded at Sacramento on that date.

The most notable feature of the weather in the lower San Joaquin Valley was the extremely low temperature and killing frost in scattered districts on the 8th, 9th, and 11th. Killing frosts have occurred as late as April 14, at Fresno. The 32° minimum on the 9th established a new low temperature for such a late date in the season and also established the lowest temperature for the month of April at that station exceeding the former low of 34° of April 1908. The minimum temperature of 34° on the 11th also equaled the former record low temperature for the month of April at Fresno and established a new low temperature for the 11th. The severity of the latter frost condition has seldom been surpassed this late in the season, according to the records of this area. Minimum temperatures in scattered districts on the morning of the 9th were as follows: Lindsay and Lewis Creek near Exeter, 27°; Parlier and Clovis, 28°; Orange Cove, 29°; Poplar and Fig Garden, 30°; Coalinga, Sanger River Bottom, Selma, and Madera, 31°. On the 11th Sanger River Bottom, Parlier, and Kingston reported a low of 30° while Fig Garden reported 29°. Damages to vineyards, potatoes, tomatoes, strawberries, squash, beans, figs, and other crops was very severe in some districts. Killing frost on successive mornings on the 8th and 9th resulted in blackening of Thompson grape shoots in widely scattered districts with some extensive and concentrated

(Continued on Page 92.)

WEATHER SUMMARY (Continued)

damages reported in the Sanger River Bottom-Monmouth-Caruthers-Biola-Kerman districts and near Clovis. Some viticulturists sustained a total destruction of shoots in vineyards. Fortunately, the bulk of the cotton crop had not been planted and germinated. Consequently, damage to cotton plants was at a minimum. Tomatoes and squash were particularly hard-hit with damages reported up to 50 percent in the Reedley and Orange Cove districts and considerably higher in the Orosi district. Strawberries fared somewhat better than other crops since ditch water was used to maintain temperatures above 32°. Caprifigs were hardest hit in the Clovis district where individual estimates of damages ranges as high as 50 to 90 percent. Adriatics were also nipped but to a lesser extent. Damage to terminal buds of Calimyrna figs was appreciable while Adriatic figs were damaged to the extent of about 10 percent in the Fig Garden district. Some spraying of figs with chemical smoke in the Fig Garden district prevented burning and blackening by the sun on the morning of the 9th. Potatoes in the Huron district were nipped despite flooding although the majority of the west-side potato fields were not damaged greatly by the frosts. Damage to Eldorado plums in Madera County was generally very light; however, one orchardist was reported to have sustained a total loss. Fourteen sections of barley in the Corcoran district near Tulare Lake were protected from frost by the use of seven crop-dusting aircraft employed for two hours on the morning of the 9th. The planes were flown continuously at a height of about 100 feet above the barley and successfully maintained a temperature of 34° at the ground level. Rains during the last week were generally beneficial to crops; however, some damages were sustained by newly-cut alfalfa. Also, rains washed sulphur from grapevines necessitating re-sulphuring. Some mildew was reported on peaches, and crusting of soils following the rains made some replanting of cotton necessary in many locations. Late grains benefited considerably from the rains as did sugar beets. A tornado which occurred in the Modesto district from 1:15 to 1:30 p.m. on the 27th demolished a 32-stanchion dairy barn, damaged other structures, and uprooted trees north and west of Modesto. The twister was erratic, passing over some districts without causing damage. Power lines were broken in three places.

Frost damages in the upper San Joaquin Valley during the second week were reported severe but variable. A few potato fields were virtually wiped out, and others were hit in spots with some fields unaffected. Considerable damage occurred to grapes in some districts. Minimum temperatures throughout Kern County ranged from 26° to 33° on the 9th and from 29° to 33° on the 11th. The frosts on the 11th were the latest ever recorded in Kern County to date. The minimum temperature of 35° at Bakersfield on the 9th was the lowest temperature recorded for April since 1929. The minimum temperature of 23° on the 8th at Sandberg on top of Bald Mountain was the lowest temperature ever recorded during April for the period of record at that station.

Below-freezing temperatures in the Santa Maria area during the second week damaged lettuce to some extent and contributed to only minor damage to potato and tomato crops. Precipitation during the latter portion of the month resulted in some decay and mold in strawberries but benefited some grain crops on the "shady side" of hills.

The lack of adequate rainfall in the Los Angeles area during the first 26 days resulted in maturing of hay and heading of grains while still very short with small heads. Temperatures during the month were generally too low for optimum growth of vegetation. Below-freezing temperatures on the 8th and 9th resulted in little or no damage except in the Ojai district where severe damage to apricots, peaches, and some damage to walnuts was reported. Rains on the 27th were of considerable benefit to crops, and in some districts were sufficient to interrupt irrigation. Late hay and grain crops were expected to improve somewhat. Strawberries and cut alfalfa hay sustained some damage as a result of the precipitation.

Precipitation during the first week in the San Diego area was too light to be of much benefit to crops. Yields of hay and grain were expected to be reduced considerably in many locations as a result of the antecedent dry weather. Much-below normal temperatures during the second week retarded ripening of strawberries to some extent. Newcastle apricots in San Pasqual Valley were damaged by frost, and pears and early apples in the Julian district sustained severe damage as a result of below-freezing temperatures.

In the Imperial Valley cool weather during the month retarded development of crops. Winds during the third week curtailed alfalfa hay-cutting operations and, together with low relative humidities, winds contributed to rapid drying of soils which was also unfavorable for cotton plantings.

HHE

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperature in °F, precipitation and evaporation in inches and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 a.m., PST, except for Weather Bureau Stations where hours of duty preclude observations at this time in which case the time is 10:30 a.m., PST. WTR EQUIV in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more.

- No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.

\+ And also on a later date or dates.

* Amounts included in following measurement, time distribution unknown.

// Gage is equipped with a windshield.

AR This entry in time of observation column in Station Index means after rain.

B Adjusted to a full month.

E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.

M One or more days of record missing: see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.

R Daily precipitation values and monthly total from recording gage.

S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December issue of this publication.

SS This entry in time of observation column in Station Index means sunset.

T Trace, an amount too small to measure.

V Includes total for previous month.

VAR This entry in time of observation column in Station Index means variable.

Subscription Price 15 cents per copy, monthly and annual: $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

SAN FRANCISCO: 1953

CALIFORNIA - MAY 1953

E. L. Felton, Section Director - San Francisco

WEATHER SUMMARY

The average temperature for the State based on 319 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 57.5° or 5.6° below the weighted mean. The unweighted average temperature based on the same 319 stations was 56.6° or 4.9° below the unweighted mean. May 1953 was the second coolest May since 1897, exceeded only by May 1933 when an unweighted average temperature of 52.2° obtained. The highest temperature for the month, 101°, was recorded at Cow Creek in Inyo County on the 18th and El Centro in Imperial County on the 22nd. The highest temperature of 101° was the lowest extreme for the State for May for the period 1897 to date. The former record low extreme maximum temperature was 104° in 1911. The lowest temperature, 5°, was recorded on the 1st at Twin Lakes at an elevation of 7920 feet in Alpine County.

The average precipitation for the State based on 325 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 1.37 inches or 0.53 inch above the weighted mean. The unweighted average based on the same 325 stations was 1.38 inch or 0.48 inch above the unweighted mean. Based on 555 stations listed in Table 3 the unweighted average was 1.34 inches or 0.44 inch above the unweighted mean. Gasquet Ranger Station in Del Norte County reported the greatest monthly precipitation, 10.30 inches. Sixty-one stations scattered throughout southern California reported less than a measurable amount of precipitation. Of this number 38 reported no precipitation and 23 recorded only a trace. The greatest daily amount, 3.24 inches, was reported from Volta Power House in Shasta County on the 19th.

Much-above normal rainfall in the north coastal area was beneficial for grasses and some other crops but contributed to slowing of plowing operations, delaying of potato planting, and hampering of sheep shearing. The 5.83 inches of precipitation for the month at Eureka was the greatest amount since 1896 when 6.22 inches of precipitation was reported at that station. The greatest precipitation amount for May at Eureka was recorded as 7.20 inches in 1889.

Much-above normal temperatures in the central coastal area during the first week were favorable for development of all crops. Cool weather with intermittent showers during the last three weeks was favorable for grasses but generally unfavorable for other crops, particularly fruits. Conditions were favorable for mildew in hops in Sonoma County and spreading of blight in cherries in Lake County. In Santa Clara County light rains contributed to some slight damage to cherries and strawberries. In Santa Cruz County some hail damage was reported to prunes in foothill districts, and fog was reported as a contributing factor to some scab damage to apples and pears in foothill canyon sections.

Much-above normal temperatures together with intermittent precipitation in the upper Sacramento Valley hampered hay-drying operations and slowed plowing, seeding, and other farm activities. Tomatoes and melons were affected adversely by the cold weather and rains, and, in many instances, were replanted. The average temperature at Red Bluff, 61.3°, was reported as the second lowest average on record at that station exceeded only by the average of 61.2° recorded in the vicinity of Red Bluff in 1896. At Mount Shasta the average temperature, 47.0°, was the lowest since May 1927 at that station when an average temperature of 46.0° was reported. The 4.7 inches of snowfall at Mount Shasta established a new record for total monthly snowfall for May since records began in 1889. Also, May was reported as the wettest since 1945 and the sixth wettest since 1900 at Mount Shasta; consequently, the fire season in that area was delayed.

Cool, showery weather in the lower Sacramento Valley was beneficial for most grain and truck crops but favorable for development of mildew in grapes and hops. Some damage to crops was reported in the Garden Valley district of El Dorado County as a result of hail on the 14th and 15th. Principal crops affected were cherries and strawberries. Much-below normal temperatures together with rains from the 23rd to 26th, inclusive, further increased development of mildew on grapes, ornamentals, grains, etc., and favored brown rot on cherries. Cool weather also favored a build-up of aphis in prunes. Rains during the cool weather were unfavorable for spraying operations. The minimum temperature of 43° at Sacramento on the 24th was the lowest temperature ever recorded on that date at that station. On the 19th strong winds in the nature of a freak "twister" in the vicinity of Orland resulted in the wrecking of a 120-foot shop building of the Lambert Chevrolet plant on the 19th. This freak windstorm also hit the Aletto building at 8th and Mills Streets, Orland, California lifting the roof about a foot and then setting it back down again, doing very little damage. The wind also picked up a chicken house and set it down also without doing much damage. Some milk cans were picked off a truck nearby on the Newville road.

Strong, desiccating winds in the lower San Joaquin Valley during the first decade resulted in sandblasting of small cotton plants on light soil, whipping of some new shoots off Thompson grapevines, knocking of fruit from some trees, and delaying of most farming operations. Crop-dusting operations for prevention of mildew in grapes and pest control operations in alfalfa and other crops were suspended temporarily due to strong winds. Cool weather was unfavorable for the germination and development of late cotton. Continued much-below normal temperatures during the last two decades of the month were generally unfavorable for all crops. Rains accompanying the low temperatures favored the development of mildew and made mildew control difficult as rains washed sulphur from the leaves. Strong winds on some days prevented sulphur dusting operations and other spraying operations. Also, temperatures were generally too low for satisfactory fuming of sulphur. In the main, stronger than normal winds prevented farmers from dusting crops with sulphur for mildew control and made the use of more expensive liquid sprays necessary to protect crops. At Fresno the average temperature for May, 61.7°, was the lowest on record at that station exceeding the previous record low average temperature of 62.4° established in May 1917. The minimum temperature of 41° on the 24th and 40° on the 26th established new low temperatures for those dates at Fresno and the maximum temperature of 60° on the 15th equaled the previous low maximum for the month of May at Fresno.

Weather in the upper San Joaquin Valley was generally unfavorable for crops with temperatures well below normal. Cotton was reported at a virtual standstill due to cool weather and grapes developed very slowly. Light rains washed considerable amounts of insecticides from plants and lowered the quality of some hay which had been cut. At Bakersfield May was reported as the coolest since 1933.

Weather in the Santa Maria area was, for the most part, unfavorable for truck crops. Hot weather in the early portion of the month followed by moist conditions favored development of mildew. Strong winds resulted in damage to outer leaves on lettuce and foliage of potatoes. Rains contributed to considerable rot on strawberries with about one-half the crop reported lost. In the Santa Barbara district strong winds resulted in considerable scarring in lemons.

High temperatures and low relative humidities together with strong winds during the first week in the Los Angeles area were generally detrimental to all crops. Some fruit and foliage were reported blown from trees, and irrigation water requirements increased. Minor structural damage was sustained in some instances, and some trees were blown down as a result of the strong winds. During the last three weeks temperatures were generally too low for optimum growth of vegetation. The maturity of grapes and the development of dates were delayed in the Coachella Valley, and citrus blooming was prolonged.

Warm weather in the San Diego area during the first week was beneficial for irrigated crops but unfavorable for hay, grains, pastures, and some other crops. Strong winds accompanying the hot weather during the first week resulted in considerable loss of bean blossoms. Cool weather during the last three weeks retarded growth and maturing of fruits and other crops, particularly string beans and cucumbers. At San Diego the maximum temperatures on the 3rd, 4th, 5th, and 6th exceeded all previous maximum temperatures on record for those dates, with the 96° on the 5th being the highest temperature experienced at that station since September 22, 1939 when 101° was recorded.

In the Imperial Valley strong, drying winds from the 3rd through the 9th resulted in some damage to the second planting of cotton. Blowing sand cut young plants after they had emerged. Strong winds also resulted in some severe scarring of cantaloupes. Strong winds during the latter portion of the month were unfavorable for the pollination of alfalfa. The weather in the Imperial Valley and Palo Verde Valley was too cool for optimum growth of crops.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are Temperature in °F, precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4 30 a.m., PST, except for Weather Bureau Stations where hours of duty preclude observations at this time in which case the time is 10 30 a.m., PST. WTR EQUIV in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more.

- No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.

+ And also on a later date or dates.

* Amounts included in following measurement, time distribution unknown.

// Gage is equipped with a windshield.

AR This entry in time of observation column in Station Index means after rain.

B Adjusted to a full month.

E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.

M One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.

R Daily precipitation values and monthly total from recording gage

S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December issue of this publication.

SS This entry in time of observation column in Station Index means sunset.

T Trace, an amount too small to measure.

V Includes total for previous month.

VAR This entry in time of observation column in Station Index means variable.

Subscription Price 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

JUNE 1953
Volume LVII No. 6

CHATTANOOGA: 1953

CALIFORNIA - JUNE 1953

E. L. Felton, Section Director - San Francisco

WEATHER SUMMARY

The average temperature for the State based on 321 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 66.1° or 3.5° below the weighted mean. The unweighted average temperature based on the same 321 stations was 63.9° or 3.6° below the unweighted mean. This was the fourth lowest unweighted June average temperature since 1923 and also the fourth lowest since averages were first computed in 1897. In June 1923 the unweighted average temperature was 62.9°; June 1944, 63.7°; and June 1952, 63.4°. The highest temperature for the month, 118°, occurred at Borego Valley in San Diego County on the 23d, and El Centro in Imperial County on the 24th. Twin Lakes in Alpine County, at an elevation of 7920 feet, recorded the lowest temperature, 17°, on the 2d.

The average precipitation for the State based on 323 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 0.51 inch or 0.21 inch above the weighted mean. The unweighted average based on the same 323 stations was 0.52 inch or 0.21 inch above the unweighted mean. Based on 539 stations listed in Table 3, the unweighted average was 0.54 inch or 0.23 inch above the unweighted mean. Round Mountain in Shasta County, reported the greatest monthly precipitation, 4.37 inches. The greatest daily precipitation amount, 2.68 inches, was recorded at Round Mountain on the 7th. One hundred eight stations, mostly in southern California, reported no precipitation, and 46 stations reported only a trace.

Rains in the north coastal area during the first decade slowed potato planting but favored growth of grasses. Pastures and ranges generally remained in good condition with ample feed for livestock.

Weather in the central coastal area was generally too cool for optimum growth of crops. Rains in Sonoma County during the first week were unfavorable for many crops contributing to cracking of cherries and very severe mildew in hops. The heaviest crop of vetch hay in some years sustained some damage from the rains. Locally heavy showers in the Santa Clara Valley on the 6th resulted in considerable damage to cherries. Bing cherries in particular were badly damaged by cracking when the sun came out following the rains. Sunshine in Santa Cruz County was beneficial in checking the advance of scab and mildew in apple orchards. Strong winds in Santa Clara County on the 18th resulted in some damage in orchards, whipping green fruit from trees, breaking limbs, and bruising some fruit. Apricots in the Santa Clara Valley were about a month later than usual due to cool weather during April, May, and June. Cherries, prunes, and other crops were delayed also as a result of the long cool period.

Rains in the upper Sacramento Valley during the first week delayed hay-baling operations and favored the development of brown rot in peaches, prunes, and apricots. Rains also hampered general farm activities, such as plowing and seeding. Much-below normal temperatures during the first half of the month contributed to making June 1953 one of the coolest of record. Higher temperatures and the lack of rainfall during the latter half of the month were favorable for the ripening of peaches and apricots and for harvesting of hay and grain.

Well-below normal temperatures in the lower Sacramento Valley during the first half of the month re
tarded development of most crops and favored milde
in fruits and field crops. Warmer weather durin
the last half of the month was favorable for rapi
growth of most crops. Strong winds on the 18th wer
unfavorable for crops in the delta section. North
erly winds from the 21st to 25th, inclusive, accom
panied by lower relative humidities were favorabl
for curtailing mildew and aphis.

Rains during the first week in the lower San Joa
quin Valley washed sulphur from grapevines necessi
tating re-dusting. However, the unusual persistenc
of strong winds contributed to delaying of sulphur
dusting operations. Generally, it was impossibl
to check the spread of mildew as a result of the un
usually cold, windy weather. Cotton was seriousl
retarded in Tulare County. Some cotton sustaine
root rot from abnormally low temperatures with ver
ticillium wilt showing in places. Strong winds als
hampered dusting of peaches, and rains also resulte
in discoloration of some hay. The maximum tempera
tures of 60° and 74° at Fresno on the 1st and 6th
respectively, were the lowest maximum temperature
ever recorded on those dates at that station. Th
maximum temperature of 60° on the 1st was 28° be
low the normal maximum for that date. Higher tem
peratures and lower relative humidities during th
last half of the month were very favorable for crops
Higher temperatures speeded the growth of cotton ar
ripening of fruits. Winds were light enough fo
dusting operations. Hay cutting and curing progress
ed, but conditions were not too favorable for balin
due to low relative humidities. The maximum tempera
ture of 91° at Fresno on the 15th ended a period o
32 consecutive days with daily maximum temperature
below normal. This was the longest period of con
secutive days with below-normal daily maximum tem
peratures in Fresno for the springtime since record
began.

Cool, cloudy weather in the upper San Joaqui
Valley during the first half of the month was, fo
the most part, unfavorable for optimum growth o
most crops, particularly cotton. Light rains o
the 6th resulted in some damage to alfalfa. Durin
the latter half of the month weather conditions wer
generally favorable for crops.

Cool weather in the Santa Maria area was favorab
for the build-up of aphis and blight which resulte
in considerable damage to walnuts. Strong winds du
ing the first week contributed to dehydration o
foliage on potato plants and scarring of lemons
Weather was, in the main, favorable for truck crop
and grains.

Weather in the Los Angeles area during the firs
decade continued generally too cool for optimum grow
th of crops. Higher temperatures during the secon
and third decades favored all crops, particularl
corn, tomatoes, black-eyed beans, and string beans

All crops and harvesting activities in the Sa
Diego area progressed under seasonable conditions

In the Imperial Valley during the first wee
cool weather retarded the development of cantaloupes
and strong winds slowed hay-baling operations
Strong winds also prevented bees from working
alfalfa fields thus reducing pollination and lat
yield of seed.

CORRECTED DATA

JANUARY 1951	NEWARK:	Precipitation on 6th, 12th and 13th should be accumulated (*). Days with .01 or more should be 18, .50 and 1.00 or more should be no record. Evaporation on 6th should be accumulated (*) and 7th, .25. Evaporation on 12th and 13th should be accumulated (*) and 14th, 1.01.
JUNE 1951	TABLE 5:	Page 229 contains erroneous data for several stations. A corrected page was printed and distributed with the July 1951 issue of Climatological Data.
AUGUST 1951	HARRIS GAGING STATION:	Storage gage record, measurement on February 28, 1951 should be 2.33, March 1, 1951, .25 and add April 28, 1951, .76, April 29, 1951, .06. Seasonal Total should be 12.16.
DECEMBER 1951	LE GRAND:	Precipitation on 21st and 22nd should be on 25th and 26th.
JANUARY 1952	FORT BRAGG:	Precipitation departure should be 2.51.
	PASO ROBLES CAA AP:	Delete temperature and precipitation departures.
FEBRUARY 1952	FOREST GLEN:	Precipitation on 1st should be 2.38, monthly total 5.13, departure -4.67, and greatest day 2.38 on 1st.
JUNE 1952	SANTA MARIA:	Delayed Data, precipitation on 5th should be .00; 6th, .67; 7th, .01; monthly total .68, departure .60, greatest day .67 on 6th and days with .50 or more 1.
SEPTEMBER 1952	EL CENTRO:	Precipitation departure should be -.50.
	SANTA BARBARA:	Precipitation departure should be -.28.
DECEMBER 1952	BENNETT RANCH:	Precipitation on 5th should be .47; 6th, Trace; 17th, Trace; monthly total 4.28, departure -1.05. Annual 1952 total should be 34.96, departure 7.65.
	DENAIR:	Precipitation departure should be 1.95.
	UNION OIL STEARNS ABS PLANT:	Precipitation .76 on 1st should be on 2nd.
	YUCCA GROVE:	Precipitation and snowfall on 28th should be .00, precipitation monthly total 1.74, departure .27, greatest day .43 on 31st, days with .01 or more 6, total snowfall 4.0 and greatest snowfall on ground 3 on 31st.
ANNUAL 1952	COLUSA HIGH SCHOOL:	Temperature Extremes and Freeze Data, Table 3, highest temperature should be 110° on July 29.
	ESCONDIDO CHURCH RANCH:	Annual precipitation total should be 19.58.
JANUARY 1953	BACKUS RANCH:	Table 6, Evaporation and Wind, max. water temperature on 5th should be 53, monthly mean 59.0.
	SUSANVILLE AP:	Max. temperature on 20th should be 44°; 31st, 67°; min. on 20th, 42°. Mean max. should be 47.3°, mean min. 28.7°, mean 38.0°, departure 7.6°, highest temperature 67° on 31st and total degree days 833.
FEBRUARY 1953	BRUSH CREEK RS:	Precipitation on 7th should be .00; 8th,Trace and monthly total .32.
	MARYSVILLE:	Max. temperature on 4th should be 51°, min. on 15th, 34°. Mean max. should be 63.3°, mean min 38.3°, mean 50.8° and departure 0.2°.
	WILLIAMS:	Max. temperature on 18th should be 58°, min. temperature on 5th, 40° and 28th, 37°. Mean max. should be 64.5°, mean min. 36.8°, mean 50.7° and total degree days 400.
MARCH 1953	ELIZABETH LAKE:	Precipitation on 1st and 2nd should be no precipitation, monthly total .66.
	LA HONDA:	Precipitation on 19th should be 1.98 and monthly total 4.02.
	NEWHALL STATE RS:	Precipitation on 1st and 2nd should be no precipitation,monthly total .18.
APRIL 1953	PAICINES OHRWALL RANCH:	Precipitation on 30th should be .27 and monthly total 1.76.
MAY 1953	LA MESA:	Add temperatures on 31st; max. 69°, min. 54°. Mean max. should be 69.8°, mean min. 50.0°, mean 59.9° and departure -3.5.
	SUSANVILLE AP:	Max. temperature on 31st should be 58°, mean max. 60.7°, mean 47.4°. Precipitation on on 31st should be .03; monthly total 1.71 and departure .67.
	TWIN LAKES:	Precipitation on the 7th, 14th and 27th should be a Trace, monthly total 5.73, departure 3.86, greatest day 1.10 on 28th and days with .01 or more 16, .50 or more 3 and 1.00 or more 1.
	YORBA LINDA:	Min. temperature on 18th should be 41°, mean min. 44.5°, mean 61.3°, departure -2.0° and total degree days 140.
